

Introduction :

- Cold cream is a water-in-oil emulsion
- Used as a cosmetic preparations mainly for cleansing, moisturizing and protection the skin.
- Formulation is based on the principle of emulsification
- Where water droplets are dispersed in an oily phase with the help of an emulsifying agent

- 
- These are applied on skin to provide smoothness and remove makeup.
 - Cold creams are named so due to the cooling effect they impart on application.
 - Cold cream is an emulsion in which the proportion of fatty and oily material predominates, although when it is applied to the skin a cooling effect is produced due to the slow evaporation of the water contained in the

- **IDEAL CHARACTERISTICS OF COLD CREAM:**
